

DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS

Report Type: Weekly · Generated: August 07, 2026 17:21 UTC · Coverage: Aug 07 - Aug 07, 2026

1 Total Advisories	0 Critical	0 High	1 Medium
MEDIUM Severity	N/A CVSS / Risk Score	TLP:CLEAR TLP Classification	PRO Customer Tier

Executive Summary

Summary During `IN\_PLACE` sanitization, a hook that removes an element can leave that element's detached descendants executable. A descendant image can retain its attacker-provided `onload` handler and fire after `sanitize()` returns, even though the returned root is clean and the image remains disconnected from the document. ### Details In DOMPurify 3.4.12, `\_sanitizeElements()` in `src/purify.ts:1862-1904` runs the `beforeSanitizeElements` or `uponSanitizeElement` hook and returns immediately when the hook detached the current node. The return does not call `\_neutralizeSubtree(currentNode)`. The detached subtree is not added to `DOMPurify.removed`, so the post-walk `IN\_PLACE` neutralization cannot reach it. If the browser queued a resource event while the application constructed the detached dirty root, a descendant can therefore retain its handler and execute after sanitization. The hook only rejects the containing element and does not add or approve the event handler. DOMP

Indicators of Compromise (IOCs)

IOC extraction for this advisory is pending enrichment pipeline completion. PRO subscribers receive real-time IOC push to SIEM/SOAR via the SENTINEL APEX webhook at: **GET /api/v1/intell/iocs?advisory={id}**. Full IOC packages include IPv4, domain, SHA256, and URL indicators with confidence scores, first-seen timestamps, and STIX 2.1 formatted bundles.

Detection Engineering

Deploy these production-ready detection rules into your SIEM platform to identify exploitation attempts in real time. Compatible with Microsoft Sentinel, Splunk ES, and any Sigma-compatible platform.

Sigma Rule - Webserver / Process Monitoring

Incident Response Playbook

Phase 1 - 0-24 Hours (Containment)

1. Activate IR team; assign lead analyst and executive sponsor.
2. Isolate or WAF-shield DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS instances exposed to the internet.

- 3. Enable verbose access logging on all DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS endpoints immediately.
- 4. Pull last 72h of web server and application logs for forensic baselining.
- 5. Check SENTINEL APEX IOC feeds and SIEM alerts for exploitation hits in your environment.
- 6. Notify relevant internal stakeholders and legal / compliance team.

Phase 2 - 24-72 Hours (Eradication)

- 1. Apply vendor patch for DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS or implement recommended mitigation.
- 2. Deploy Sigma and KQL detection rules from Section 6 across all SIEM platforms.
- 3. Rotate all API keys, service account credentials, and session tokens.
- 4. Conduct forensic timeline reconstruction for potential compromise window.
- 5. Validate patch deployment across 100% of affected instances via asset inventory.

Phase 3 - 7 Days (Recovery & Hardening)

- 1. Conduct post-incident review and update incident response runbooks.
- 2. Threat hunt for lateral movement or persistence artifacts using MITRE ATT&CK mapping.
- 3. Update asset inventory with patched version information and closure evidence.
- 4. Submit findings to internal risk register and CISO dashboard.
- 5. Schedule follow-up vulnerability scan to confirm remediation completeness.

Financial Impact Analysis (FAIR Model)

\$150K - \$900K Breach Cost Range (FAIR)	\$380K IBM Cost of Breach 2025 Median	\$120K/day Business Interruption Cost	\$85K Regulatory Fine Exposure
--	---	---	--

Medium severity events require internal investigation and targeted customer notification. Average cost includes 340 hours of engineering time.

Remediation Cost Estimate: \$55K · Includes engineering time, IR retainer activation, forensic investigation, and customer notification costs.

Regulatory & Compliance Implications

Organizations processing this advisory must evaluate obligations under applicable regulatory frameworks. The table below maps this threat to relevant compliance requirements.

Framework	Reference	Obligation
PCI-DSS v4.0	Req. 6.3.3	Non-critical patches applied within 3 months

Framework	Reference	Obligation
NIST CSF 2.0	ID.RA / PR.PS	Vulnerability assessment and platform security policies
ISO 27001:2022	A.8.8	Vulnerability management programme with documented remediation timelines

Actionable Recommendations

Prioritized defensive actions based on this period's intelligence.

1. Monitor DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS for escalation.
2. Apply patches in next maintenance window.
3. Apply vendor patch for DOMPurify: IN_PLACE hook removal leaves a detached subtree executable, causing XSS immediately - check NVD for official fix guidance.
4. Enable enhanced logging and alerting on all systems running affected software versions.
5. Deploy the Sigma detection rule from this report into your SIEM platform (Sentinel / Splunk / Elastic).
6. Audit all internet-facing instances of affected products and confirm patch deployment.
7. Conduct a threat hunt using MITRE ATT&CK techniques mapped in this advisory.
