

openhole-server vulnerable to path traversal via URL-decoded request path

Report Type: Weekly · Generated: July 29, 2026 05:04 UTC · Coverage: Jul 28 - Jul 29, 2026

1 Total Advisories	0 Critical	1 High	0 Medium
HIGH Severity	8.6 CVSS / Risk Score	TLP: CLEAR TLP Classification	PRO Customer Tier

Executive Summary

Summary openhole-server forwarded the URL-decoded request path (`r.URL.Path`) to tunnel clients instead of the original request-target. Percent-encoded dot-segments (`%2e`) and separators (`%2f`) were decoded to ``.`` and ``/`` before reaching the local service. Go's ServeMux rejects literal ``.`` paths, but percent-encoded traversal sequences bypassed this and were delivered to backends as working path traversal. ## Impact An unauthenticated remote attacker could read files outside the published web root on tunneled local services that resolve paths without canonicalization. Example: - `/%2e%2e/secret.txt` → file outside web root - `/%2e%2e/%2e%2e/etc/passwd` → sensitive files Encoded slashes (`/a%2fb`) could also bypass path-based access controls. ## Fix v0.1.2 forwards `r.URL.EscapedPath()` on the server and preserves the request-target on the CLI client. Users should upgrade both openhole-server and the openhole CLI to v0.1.2 or later.

Indicators of Compromise (IOCs)

IOC extraction for this advisory is pending enrichment pipeline completion. PRO subscribers receive real-time IOC push to SIEM/SOAR via the SENTINEL APEX webhook at: **GET /api/v1/intel/iocs?advisory={id}**. Full IOC packages include IPv4, domain, SHA256, and URL indicators with confidence scores, first-seen timestamps, and STIX 2.1 formatted bundles.

Detection Engineering

Deploy these production-ready detection rules into your SIEM platform to identify exploitation attempts in real time. Compatible with Microsoft Sentinel, Splunk ES, and any Sigma-compatible platform.

Incident Response Playbook

Phase 1 - 0-24 Hours (Containment)

1. Activate IR team; assign lead analyst and executive sponsor.
2. Isolate or WAF-shield openhole instances exposed to the internet.
3. Enable verbose access logging on all openhole endpoints immediately.
4. Pull last 72h of web server and application logs for forensic baselining.

- 5. Check SENTINEL APEX IOC feeds and SIEM alerts for exploitation hits in your environment.
- 6. Notify relevant internal stakeholders and legal / compliance team.

Phase 2 - 24-72 Hours (Eradication)

- 1. Apply vendor patch for openhole or implement recommended mitigation.
- 2. Deploy Sigma and KQL detection rules from Section 6 across all SIEM platforms.
- 3. Rotate all API keys, service account credentials, and session tokens.
- 4. Conduct forensic timeline reconstruction for potential compromise window.
- 5. Validate patch deployment across 100% of affected instances via asset inventory.

Phase 3 - 7 Days (Recovery & Hardening)

- 1. Conduct post-incident review and update incident response runbooks.
- 2. Threat hunt for lateral movement or persistence artifacts using MITRE ATT&CK mapping.
- 3. Update asset inventory with patched version information and closure evidence.
- 4. Submit findings to internal risk register and CISO dashboard.
- 5. Schedule follow-up vulnerability scan to confirm remediation completeness.

Financial Impact Analysis (FAIR Model)

\$800K - \$4.5M Breach Cost Range (FAIR)	\$1.8M IBM Cost of Breach 2025 Median	\$450K/day Business Interruption Cost	\$320K Regulatory Fine Exposure
--	---	---	---

High severity incidents activate IR retainers, forensic investigation (avg 47 days), and reputational damage impacting 12-18% of revenue.

Remediation Cost Estimate: \$180K · Includes engineering time, IR retainer activation, forensic investigation, and customer notification costs.

Regulatory & Compliance Implications

Organizations processing this advisory must evaluate obligations under applicable regulatory frameworks. The table below maps this threat to relevant compliance requirements.

Framework	Reference	Obligation
GDPR	Art. 32 / Art. 33	Appropriate technical measures; notify DPA if personal data affected
PCI-DSS v4.0	Req. 6.3.3	Patches within 1 month; documented risk acceptance if deferred
NIS2 Directive	Art. 21	Risk management measures including vulnerability handling policies
NIST CSF 2.0	RS.MI / RC.RP	Incident mitigation and recovery planning; post-incident review

Actionable Recommendations

Prioritized defensive actions based on this period's intelligence.

1. Apply patches immediately for openhole-server vulnerable to path traversal via URL-decoded request path.
2. Enable enhanced monitoring for related IOCs.
3. Review SIEM rules for associated MITRE ATT&CK techniques.
4. Apply vendor patch for openhole-server vulnerable to path traversal via URL-decoded request path immediately - check NVD for official fix guidance.
5. Enable enhanced logging and alerting on all systems running affected software versions.
6. Deploy the Sigma detection rule from this report into your SIEM platform (Sentinel / Splunk / Elastic).
7. Audit all internet-facing instances of affected products and confirm patch deployment.
